

List of questions you should ask IT / Security department before meeting us

1. IT department approval for project implementation

- We want to implement the Share application to improve hybrid work in the company. Do you see any technical limitations?

2. Internal requirements

- Do you have any requirements for the product we want to implement? If not, that's okay! We'll find out how the application works in other companies at the meeting.

3. Security questionnaire

- Will Parkanizer need to complete a safety questionnaire?
- Do we have a security policy or technological requirements that Parkanizer should know?

4. Data storage

- Share is a SaaS (Software as a Service), and data is stored on the Parkanizer side. Is it okay for you?
- Do you require installation on company servers?

5. System integration

- Share enables integration with the client's SSO, Azure Active Directory, or other employee identity providers. In this case, we will need technical configuration on our side. Does this suit you?

6. Tests

- Will we be testing the app for 30 days before the full implementation of the Share application. Who will take part in this?

7. Designation of people responsible for the implementation

- Who on our side will supervise the implementation and tests?

8. Additional questions

- Is there anything else from your perspective that we should ask Parkanizer before implementing the application to the company?
